ABSTRACT

PURPOSE: To securely transfer a message to the person himself even if a person excepting the person himself has received a telephone call by transmitting a transfer informing message from an answering tape previous to a transfer message which has been recorded in a reception tape at the time of message transfer.

CONSTITUTION: The answering tape TP1 in which a normal answering message that prompts a caller for recording and the transfer informing message which informs a receiver in a transfer destination of a transfer telephone call at the time of message transfer are recorded is provided. A control circuit 5 which transmits the transfer informing message from the answering tape TP1 previous to the transfer message which has been recorded in the reception tape TP2 at the time of message transfer is provided. Consequently, the transfer informing message is transmitted first through the circuit in the message transfer destination. After the confirmation of the person himself based on the informing message, a prescribed operation such as the input of a security code is executed and the transfer message can be heard.
